

HOJATHON Problem Statement

Agentic AI Hackathon 2026 • Series 01

CONDUCTED BY HOJA TECHADEMY

Public Services & Civic Agents

AI agents that help people interact with government services. They can help fill out forms, check eligibility, track complaints, or direct people to the right department without requiring them to understand complicated government procedures.

Healthcare & Wellness Agents

AI agents that support patients, doctors, and hospital staff by helping with tasks such as basic triage, appointment scheduling, follow-ups, reminders, or personal wellness support.

Education & Skilling Agents

AI agents that make learning more personalized. They can explain topics in different ways, create practice questions, help with exam preparation, and adjust to a student's learning pace and level.

Agriculture & Local Economy

AI agents that help farmers and small businesses make better decisions using information such as weather, crop conditions, prices, and market trends. Think of it as a personal advisor for people who may not have access to one.

Disaster Management & Public Safety Agents

AI agents that help detect, predict, and coordinate responses during emergencies such as floods, landslides, fires, or large public events, where quick action and coordination are important.

FYI

What do we mean by an "AI Agent"?

An AI agent is more than just a chatbot that answers questions.

We are looking for systems that can understand a goal, remember relevant information, make decisions, use tools, and take actions to accomplish that goal.

For example, instead of simply telling someone "You are eligible for this government service," an agent could check the user's information, determine their eligibility, collect the required details, fill out the form, submit it through the appropriate service, and remember the status so it can follow up later.

Important Note for Students

These are only suggested areas, not limitations.

You do not have to build your project within these categories. Feel free to identify any real-world problem. We want you to think beyond the examples given here and come up with your own ideas.
